

[Software solution for data protection management

Ever more comprehensive data protection regulations as well as constantly increasing laws and regulations present companies with major challenges when dealing with personal data. Since May 2018, the previous data protection law and regulations on processing personal data in the German Data Protection Act (BDSG) have been replaced or supplemented by the binding EU GDPR.

With our data protection management system antares RiMIS® DPMS, we help you to master the new requirements of the General Data Protection Regulation for commissioned processing in your company and to establish new processes and structures.

[Certification according to ISO 27001 and IT baseline protection

Our DPMS based on the European Basic Regulation ISO 27001 and/or recognised procedures based on IT baseline protection. This procedure allows processes and guidelines to be methodically introduced into a company. The guidelines allow Data Protection violation risks to be identified with the aim of managing, controlling and constantly improving them along with all technical and organisational measures. The guarantee of confidentiality, integrity, availability and durability of IT systems and services in relation to data processing is implemented in a DPMS in a similar way to an ISMS.

[DPMS process

The German IT Security Act and the EU GDPR have increased the importance of information security and data protection in information technology. To master the requirements in the company, it makes sense to integrate the data protection guidelines into the existing information security management system (ISMS). By integrating the data protection topic into the existing ISMS, a holistic data protection management system (DPMS) is created.

[Modular extensibility

Compliance

Action planning for compliance violations

CIRS

Transparency of critical events

ICS

Software-based internal process control

ISMS

Information security management system

[Benefit from the features of our solution

- Complete and audit-proof documentation of all data protection and information security activities incl. directory of processing activities.
- Seamless integration of information and business processes that require protection.
- Verbesserung der Datenschutzorganisation durch Einbindung der Europäische Datenschutz-Grundverordnung (EU-DSGVO) in ein ISMS.
- Compliance with all data protection and information security requirements.
- In the event of an audit, meet the accountability requirements of the basic regulation to supervisory authorities and avoid fines.
- Protection needs analysis and risk assessment, including the data protection risk management measures derived from them.
